

VOLUME ANALYSIS

A comparison of volumes and POC points of the clusters with other platforms and tools to verify their behavior is made, the ideal is to be able to see the real volume or tick, also to be able to see the big trades in the graph.

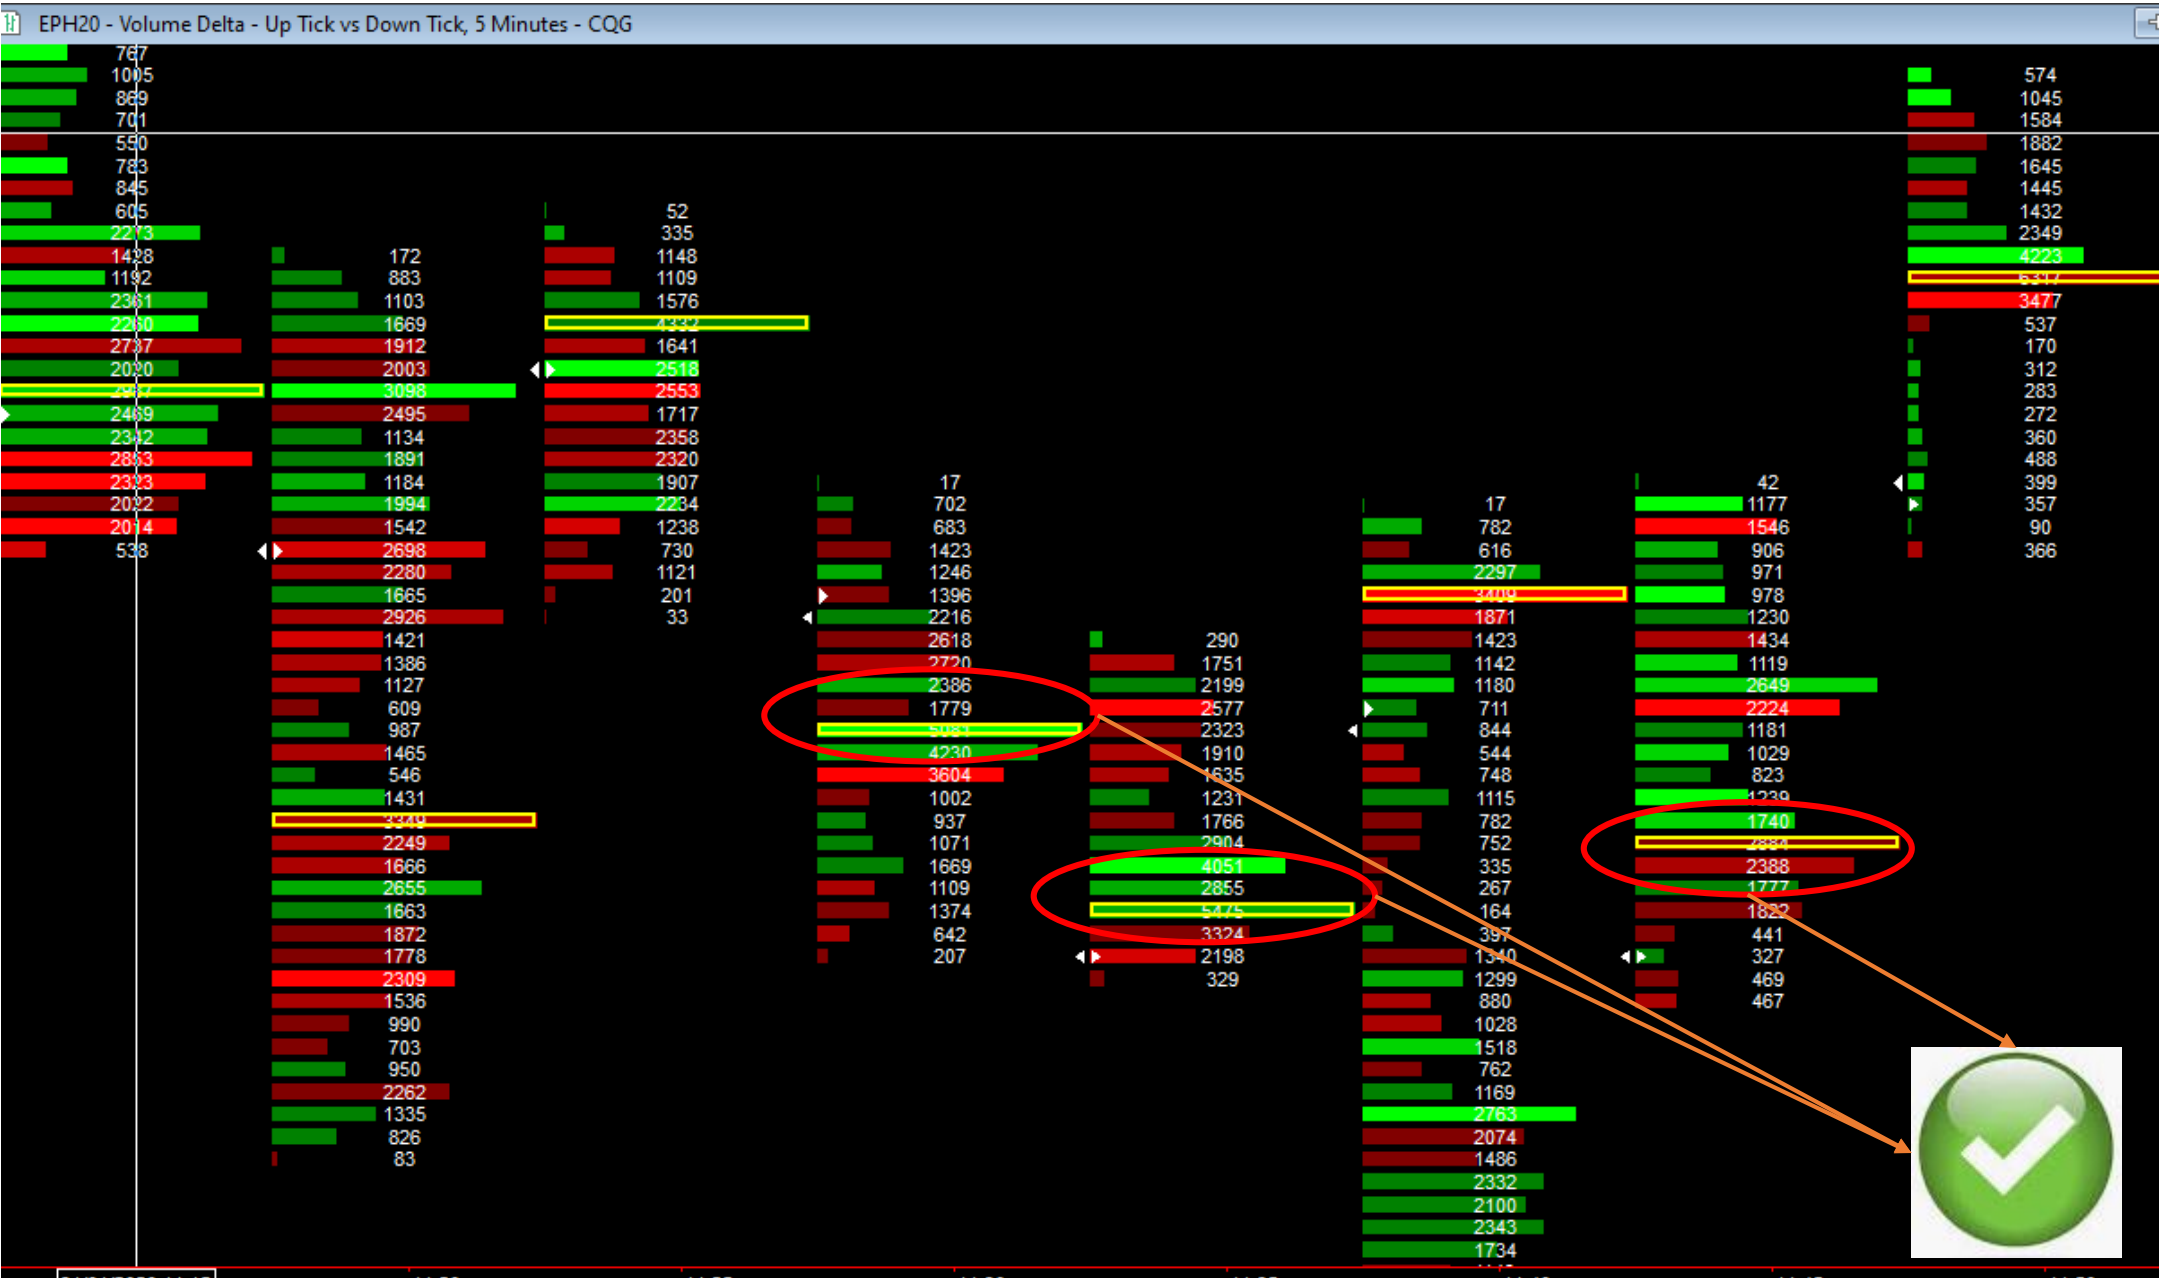

These presented configurations are widely used in the traders of the Colombian and Latin American trading academies, which is something that does impact on South American trading.

MT5 tool
(<https://www.mql5.com/es/market/product/2835>), compares POC points and cluster volumes, they are real and adequate live and direct all reading is correct, compared with a multicharts account / CQG.
